

## **Remicade Infusions**

Patients who have moderate to severe Crohn's Disease (Regional Enteritis) or Ulcerative Colitis are good candidates for Remicade infusions. Remicade has been available for over ten years and has been shown to be extremely effective in relieving the symptoms of Crohn's Disease by blocking the effects of TNF (tumor necrosis factor), a protein involved in the inflammatory process of Crohn's Disease.

Intravenous Remicade infusions at Westside GI Specialists are administered by a highly experienced nurse in the comfort of our offices in Knoxville or Lenoir City. "We are pleased to be able to offer Remicade infusions at our offices at Westside GI Specialists," said Dr. Crist. "It is more comforting for our patients to receive this therapy in one of our offices instead of having to go to the hospital. Moreover, the costs are significantly reduced in an office setting as compared to the hospital."
